MILECOLO, THERE HAS BEEN PRESENTED TO THE

## Secretary of Agriculture

AN APPLICATION REQUESTING A CERTIFICATE OF PROTECTION FOR AN ALLEGED DISTINCT VARIETY OF SEXUALLY REPRODUCED, OR TUBER PROPAGATED PLANT. THE NAME AND DESCRIPTION OF WHICH ARE CONTAINED IN THE APPLICATION AND EXHIBITS, A COPY OF WHICH IS HEREUNTO ANNEXED AND MADE A PART HEREOF, AND THE VARIOUS REQUIREMENTS OF LAW IN SUCH CASES MADE AND PROVIDED HAVE BEEN COMPLIED WITH, AND THE THE THERETO IS, FROM THE RECORDS OF THE PLANT VARIETY PROTECTION OFFICE, IN THE APPLICANT(S) INDICATED IN THE SAID COPY, AND WHEREAS, UPON DUE EXAMINATION MADE, THE SAID APPLICANT(S) IS (ARE) ADJUDGED TO BE ENTITLED TO A CERTIFICATE OF PLANT VARIETY PROTECTION UNDER THE LAW.

NOW, THEREFORE, THIS CERTIFICATE OF PLANT VARIETY PROTECTION IS TO GRANT UNTO THE SAID APPLICANT(S) AND THE SUCCESSORS HEIRS OR ASSIGNS OF THE SAID APPLICANT(S) FOR THE TERM OF TWENTY TEARS FROM THE DATE OF THIS GRANT, SUBJECT TO THE PAYMENT OF THE REQUIRED FEES AND PERIODIC REPLEMISHMENT OF VIABLE BASIC SEED OF THE VARIETY IN A PUBLIC REPOSITORY AS PROVIDED BY LAW, THE RIGHT TO EXCLUDE OTHERS FROM SELLING THE VARIETY, OR OFFFERING IT FOR SALE, OR REPRODUCING IT, OR MEDITING IT, OR EXPORTING IT, OR CONDITIONING IT FOR PROPAGATION, OR STOCKING IT FOR ANY OF THE DECREPOSES, OR USING IT IN PRODUCING A HYBRID OR DIFFERENT VARIETY THEREFROM, TO THE EXTENT DECREPOSES, OR USING IT IN PRODUCING A HYBRID OR DIFFERENT VARIETY THEREFROM, TO THE EXTENT DECREPOSES THE PLANT VARIETY PROTECTION ACT. (84 STAT. 1542, AS AMENDED, 7 U.S.C. 2321 ET SEQ.)

#### ZINNIA

'PAS490443'

In Testimon Morrest, I have hereunto set my hand and caused the seal of the Plant Bariety Protection Office to be affixed at the City of Washington, D.C. this twenty-fifth day of November, in the year two thousand and eight.

CAPACITY OR TITLE

WW 12, 2007

DATE

CAPACITY OR TITLE

Patent Agent

(See reverse for instructions and information collection burden statement)

GENERAL INSTRUCTIONS: To be effectively filed with the Plant Variety Protection Office (PVPO), ALL of the following items must be received in the PVPO: (1) Completed application form signed by the owner; (2) completed exhibits A, B, C, E, F; (3) for a tuber reproduced variety, verification that a viable (in the sense that it will reproduce an entire plant) tissue culture will be deposited and maintained in an approved public repository; and (4) payment by credit card or check drawn on a U.S. bank for \$4,382 (\$518 filing fee and \$3,864 examination fee), payable to "Treasurer of the United States" (See Section 97.6 of the Regulations and Rules of Practice). NEW: With the application for a seed reproduced variety or by direct deposit soon after filing, the applicant must provide at least 3,000 viable untreated seeds of the variety per se, and for a hybrid variety at least 3,000 untreated seeds of each line necessary to reproduce the variety. Partial applications will be held in the PVPO for not more than 90 days; then returned to the applicant as un-filed. Mail application and other requirements to Plant Variety Protection Office, AMS, USDA, Room 401, NAL Building, 10301 Baltimore Avenue, Beltsville, MD 20705-2351. Retain one copy for your files. All items on the face of the application are self explanatory unless noted below. Corrections on the application form and exhibits must be initialed and dated. DO NOT use masking materials to make corrections. If a certificate is allowed, you will be requested to send a payment by credit card or check payable to "Treasurer of the United States" in the amount of \$768 for issuance of the certificates will be issued to owner, not licensee or agent.

**NOTES:** It is the responsibility of the applicant/owner to keep the PVPO informed of any changes of address or change of ownership or assignment or owner's representative during the life of the application/certificate. The fees for filing a change of address; owner's representative; ownership or assignment; or any modification of owner's name is specified in Section 97.175 of the regulations. (See Section 101 of the Act, and Sections 97.130, 97.131, 97.175(h) of the Regulations and Rules of Practice.)

**Plant Variety Protection Office** 

Telephone: (301) 504-5518 FAX: (301) 504-5291

General E-mail: PVPOmail@usda.gov

Homepage: http://www.ams.usda.gov/science/pvpo/PVPindex.htm

#### SPECIFIC INSTRUCTIONS:

To avoid conflict with other variety names in use, the applicant must check the appropriate recognized authority and **provide evidence** that the permanent name of the application variety (even if it is a parental, inbred line) has been cleared by the appropriate recognized authority before the Certificate of Protection is issued. For example, for agricultural and vegetable crops, contact: U.S. Department of Agricultura, Agricultural Marketing Service, Livestock and Seed Programs, **Seed Regulatory and Testing Branch**, 801 Summit Crossing Place, Suite C, Gastonia, North Carolina 28054-2193 Telephone: (704) 810-8870. http://www.ams.usda.gov/lsg/seed.htm.

#### ITEM

19a. Give:

- (1) the genealogy, including public and commercial varieties, lines, or clones used, and the breeding method;
- (2) the details of subsequent stages of selection and multiplication;
- (3) evidence of uniformity and stability; and
- (4) the type and frequency of variants during reproduction and multiplication and state how these variants may be identified
- 19b. Give a summary of the variety's distinctness. Clearly state how this application variety may be distinguished from all other varieties in the same crop. If the new variety is most similar to one variety or a group of related varieties:
  - (1) identify these varieties and state all differences objectively;
  - (2) attach replicated statistical data for characters expressed numerically and demonstrate that these are clear differences; and
  - (3) submit, if helpful, seed and plant specimens or photographs (prints) of seed and plant comparisons which clearly indicate distinctness.
- 19c. Exhibit C forms are available from the PVPO Office for most crops; specify crop kind. Fill in Exhibit C (Objective Description of Variety) form as completely as possible to describe your variety.
- 19d. Optional additional characteristics and/or photographs. Describe any additional characteristics that cannot be accurately conveyed in Exhibit C. Use comparative varieties as is necessary to reveal more accurately the characteristics that are difficult to describe, such as plant habit, plant color, disease resistance, etc.
- 19e. Section 52(5) of the Act requires applicants to furnish a statement of the basis of the applicant's ownership. An Exhibit E form is available from the PVPO.
- 20. If "Yes" is specified (seed of this variety be sold by variety name only, as a class of certified seed), the applicant MAY NOT reverse this affirmative decision after the variety has been sold and so labeled, the decision published, or the certificate issued. However, if "No" has been specified, the applicant may change the choice. (See Regulations and Rules of Practice, Section 97.103).
- 23. See Sections 41, 42, and 43 of the Act and Section 97.5 of the regulations for eligibility requirements.
- 24. See Section 55 of the Act for instructions on claiming the benefit of an earlier filing date.
- 22. CONTINUED FROM FRONT (Please provide a statement as to the limitation and sequence of generations that may be certified.)
- 23. CONTINUED FROM FRONT (Please provide the date of first sale, disposition, transfer, or use for each country and the circumstances, if the variety (including any harvested material) or a hybrid produced from this variety has been sold, disposed of, transferred, or used in the U.S. or other countries.) Sold to Ball Ducrettet, France and Ball Holland, the Netherlands for resale in 12/2006
- 24. CONTINUED FROM FRONT (Please give the country, date of filing or issuance, and assigned reference number, if the variety or any component of the variety is protected by intellectual property right (Plant Breeder's Right or Patent).)

According to the Paperwork Reduction Act of 1995, an agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a valid OMB control number for this information collection is 0581-0055. The time required to complete this information collection is estimated to average 1.4 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or part of an individual's income is derived from any public assistance program (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice

To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410, or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

#### **EXHIBIT A**

Breeding History of the Zinnia marylandica Variety 'PAS490443'

The zinnia species Zinnia marylandica is an amphidiploid produced by colchicine-induced doubling of sterile interspecific hybrids of Zinnia angustifolia and Zinnia violaceae [see in Exhibit D, 'Spooner, D.M., D.P. Stimart and T.H. Boyle. 1991. Zinnia marylandica (Asteraceae: Heliantheae), a new disease-resistant ornamental hybrid. Brittonia 43:7-10].

In the following crossing record the first line referred to in each cross is always the female.

In 2000 the Z. marylandica variety 'Pinwheel Yellow' (Ball Horticultural Company) was used as the female in a cross with the Z. marylandica variety 'Profusion White' (also referred to as Zinnia hybrida, PVPO 9800350, Sakata Seed Corporation). Seed of the resultant  $F_1$  hybrid ZM00762 was sown in the spring of 2001. Three  $F_1$  plants were self-pollinated. The  $F_1$  selections were labeled ZM00762-1, ZM00762-2, and ZM00762-3. From each plant  $F_2$  seed was harvested separately in the fall of 2001.

The  $F_2$  seed from all three  $F_1$  selections was sown separately in the spring of 2002. Among the resultant  $F_2$  plants from line ZM00762-3, ten selections were made, mainly for large flowers, and those plants were self-pollinated.  $F_3$  seed was harvested separately from each selection in the fall of 2002. In 2003 and 2004, six  $F_3$  and four  $F_4$  single plant selections were made, respectively, using the same criteria as in the  $F_2$  as well as selection for germination, uniform yellow color, and uniformity of habit.

The  $F_5$  seed from all three  $F_4$  selections was sown in the spring of 2005. It was determined that line ZM00762-3-1-4-3 had uniformly large, yellow flowers, a uniform habit, and germinated and yielded well. Open-pollinated  $F_6$  seed was produced from 70 plants of this line. The line was now labeled F9469M with the pedigree ZM00762-3-1-4-3-m05. The  $F_6$  seed was harvested in September 2005.

The  $F_6$  seed was sown in November 2005 and open-pollinated seed was harvested from 3667 plants in March of 2006. In April 2006 both the 2005 and 2006 harvested seed increases produced through open pollination as well as remnant  $F_5$  breeder's seed were sown in trials. F9469M was shown to be both uniform for all characters (e.g. flower size, color, plant habit, flowering date), as well as stable across these three generations. F9469M was then assigned the variety name 'PAS490443'.

Variants appear in 'PAS490443' at a frequency of about 3.1 percent. These variants have lengthened internodes but are identical to the variety in all other characteristics as described in Exhibit C. These variants are known to be the result of spontaneous mutation due to aneuploidy. This type of mutation occurs in most, if not all, *Zinnia marylandica* varieties and is a characteristic of the species. These variants are commercially acceptable and predictable.

#### **EXHIBIT B**

Statement of Distinctness of the Zinnia marylandica Variety 'PAS490443'

'PAS490443' is most readily distinguished from 'Pinwheel Yellow', which is the most similar commercial variety available, by growth habit.

The compact growth habit of 'PAS490443' compared to 'Pinwheel Yellow' is shown in Table 1 below. Greenhouse trials were conducted in two locations: Santa Paula, California and Elburn, Illinois. For analysis, growth habit was measured as plant height, the distance from the soil surface to the top of the highest flower for twelve plants of each variety. In both trials, 'PAS490443' was found to be significantly more compact than the comparison 'Pinwheel Yellow'.

Table 1. Compact growth habit of 'PAS490443' compared to 'Pinwheel Yellow'.

Trial	'PAS490443'	'Pinwheel	Sample	t	t	P Value
	Average	Yellow'	Size	Critical	Statistic

PLEASE READ ALL INSTRUCTIONS CAREFULLY				
In the spaces on the left, enter the appropriate numbers that describe the characteristics of the application variety. On the right, enter the appropriate numbers that describe the characteristics of the most similar comparison variety. Right justify whole numbers by adding leading zeros if necessary. The variety that you choose for comparison should be the most similar one in terms of overall morphology, background and maturity. The comparison variety should be grown in field trials with the application variety for 2-3 location/years (environments) in the region and season of best adaptability. At least one year of trials should be conducted within the United States of America. In general, measurements of quantitative traits should be taken <b>from one trial on 15-25 randomly selected plants or plant parts</b> to obtain averages and statistics that describe a typical field of the variety. (Form technical content last updated August 1978.)

#### ZINNIA MARYLANDICA (ASTERACEAE: HELIANTHEAE), A NEW DISEASE-RESISTANT ORNAMENTAL HYBRID

DAVID M. SPOONER, DENNIS P. STIMART, AND THOMAS H. BOYLE

Spooner, David M. (Vegetable Crops Research Unit, Agricultural Research Service, USDA, Department of Horticulture, University of Wisconsin, Madison, WI 53706), Dennis P. Stimart (Department of Horticulture, University of Wisconsin, Madison, WI 53706), and Thomas H. Boyle (Department of Plant and Soil Science, University of Massachusetts, Amherst, MA 01003). Zinnia marylandica (Asteraceae: Heliantheae), a new disease-resistant ornamental hybrid. Brittonia 43: 7-10. 1991.—Zinnia marylandica, an artificial hybrid between Z. angustifolia var. angustifolia (2n = 22, female) and Z. violacea (2n = 24, male), is described and illustrated. Zinnia marylandica is a stabilized amphiploid (2n = 46) produced by colchicine-induced doubling of the sterile interspecific hybrids. It exhibits disease resistance to powdery mildew (Erysiphe cichoracearum), alternaria blight (Alternaria zinniae), and bacterial leaf and flower spot (Xanthomonas campestris pv. zinniae).

The genus Zinnia L. (Asteraceae: Heliantheae) comprises approximately 11 species of annual or perennial herbs or low shrubs, all endemic to the western hemisphere and largely restricted to Mexico (McVaugh, 1984; Torres, 1963). Zinnia violacea Cav. [including Z. elegans Jacq. (McVaugh, 1984)] is the most widely cultivated species and is prized among garden ornamentals for its large, showy inflorescences and diversity of ray floret colors and petal forms. Plants are erect, 9–100 cm in height, sparsely-branched, with large, ovate to lanceolate leaves; and cultivated forms have one to several whorls of ray florets. The chromosome number is n = 12 (Torres, 1963; Terry-Lewandowski et al., 1984).

A second species, Z. angustifolia H.B.K. var. angustifolia, is less extensively cultivated and is morphologically distinct from Z. violacea. Plants are semi-decumbent, 20-40 cm in height, profusely branched, with linear to oblong-elliptic leaves and masses of small flowers with a single whorl of orange or white ray florets (Torres, 1963). The chromosome number is n = 11 (Olorode, 1970; Terry-Lewandowski et al., 1984).

Although Z. violacea is popular as a bedding plant and cut flower, the species is prone to attack by several pathogens. In the United States, three pathogens in particular incite moderate to severe epiphytotics within Z. violacea plantings: Erysiphe cichoracearum DC. ex Merat causing powdery mildew (Baker & Locke, 1946; Morrison, 1960; Andersen, 1971), Alternaria zinniae Pape causing alternaria blight (Dimock & Osborn, 1943; Baker & Davis, 1950; Lipschutz, 1965), and Xanthomonas campestris pv. zinniae Hopkins & Dowson causing bacterial leaf and flower spot (Sleesman et al., 1973; Strider, 1976). Powdery mildew is the most serious disease of Zinnia in the United States, and susceptibility of Z. violacea cultivars to powdery mildew appears to be a major contributing factor to declining sales of zinnia seed (L. Drewlow, pers. comm.). Zinnia angustifolia is highly resistant or immune to all three pathogens and therefore represents a valuable germplasm source for genetic manipulations (Andersen, 1971; Jones & Strider, 1979; Lipschutz, 1965).

Studies were initiated at the University of Maryland in 1979 to determine if interspecific hybridization between Z. angustifolia and Z. violacea could be achieved, with the primary goal of developing disease-resistant hybrids with unique flower colors and plant habits. Although interspecific hybrids were obtained from reciprocal crosses, hybridization was more successful when Z. angustifolia was the maternal parent (Boyle & Stimart, 1982). Embryo abortion, poor seed ger-

mination, and abnormal plant development among some hybrids acted as post-zygotic barriers to interspecific hybridization (Boyle et al., 1987).

Cytological examinations of interspecific hybrids indicated a somatic chromosome number of 2n = 23 (Terry-Lewandowski et al., 1984), and all plants were sterile. Lagging univalents and an irregular distribution of chromosomes were major factors contributing to hybrid sterility. Partial fertility was restored by treatment of axillary buds with aqueous colchicine (Boyle & Stimart, 1982; Terry-Lewandowski et al., 1984). The colchicine-induced amphiploids (2n = 46) formed predominantly bivalents at metaphase I due to suppression of pairing between homologous chromosomes. As a consequence, these segmental allopolyploids performed both cytologically and genetically as diploids and bred true from seed with little or no segregation in later generations (Terry-Lewandowski et al., 1984). We name this hybrid species after the University of Maryland, the institution where hybridization and genetic studies were initiated. Cross-combinations that produced this hybrid are found in Boyle & Stimart (1982):

### Zinnia marylandica D. M. Spooner, D. P. Stimart & T. H. Boyle, sp. nov. (Fig. 1)

Plantae inter Z. angustifoliam H.B.K. var. angustifoliam (2n = 22) et Z. violaceam (2n = 24) Cav. hybridae, ut Z. violacea e basi ramosissimae, statura inter parentes intermediae, chromosomatum numerus = 46.

Annual herb. Stems 35-55 cm tall, 0.7-1.3 cm diam, highly branched at base and overall shape of plant hemispherical or urn-shaped, brown to greenish-yellow, pubescent. Leaves sessile to subsessile; blades 5-12 cm long, 1.5-4.5 cm wide, lanceolate to ovate to oblanceolate; scabrous and sessile, glandular ad- and abaxially; base cuneate; apex acute to acuminate; margins entire. Capitulescences solitary; peduncles 1-10 cm long, 1-3 mm diam, tomentose. Heads radiate, 15-20 mm long, 40-60 mm diam across extended rays. Involucre campanulate, 9-10 mm long, 18-22 mm diam, phyllaries imbricate, 20-32, 4-seriate, reflexed apically, light green to yellow or brown, dark brown and erose at the apex, glabrous to glandular-tomentose; outer phyllaries broadly obovate, 6-8.5 mm long, 5-8 mm wide; inner phyllaries obovate, 10-12 mm long, 4-6 mm wide. Pales conduplicate, 10-14 mm long, 2-2.2 mm wide, stramineous, glabrous except strigose on keel, acute to erose at apex. Ray florets 13-17; pistillate and fertile, persistent on the achenes, ligules creamy white to yellow to red-orange adaxially, greenishyellow abaxially; 15-28 mm long, 8-15 mm wide; achenes 4-7.5 mm long, 2.5-3.2 mm wide, oblanceolate, 3-angled, strigose, margins ciliate, tuberculate when mature. Disc florets 120-150, corollas yellow to red-orange, 10-11 mm long, 1-1.3 mm diam; lobes 2-4.5 mm long, 0.5-0.8 mm wide; achenes 5-7 mm long, 2.8-3.2 mm wide, obovate, laterally flattened, strigose, ciliate at margins, black, brown or black-brown mottled or with whitish longitudinal lines; pappus of 1 or 2 persistent awns to 4.5 mm long.

Type: U.S.A.: Cultivated amphiploid plant grown at the University of Wisconsin-Madison, resulting from crosses between Zinnia angustifolia H.B.K. var. angustifolia and Z. violacea Cav., 28 Aug 1988, Stimart 1 (HOLOTYPE: WIS; ISOTYPES: MARY, OS).

Early hybridization attempts between Z. angustifolia and Z. violacea utilized an orange-flowered cultivar of Z. angustifolia (Boyle & Stimart, 1982). Interspecific hybrids from these crosses did not express the diversity in ray floret color found among the Z. violacea cultivars used as pollen parents. Instead, hybrids displayed orange, scarlet, or yellow ray florets, i.e., colors more closely resembling the Z. angustifolia parent. A white-flowered cultivar of Z. angustifolia was used in later hybridization attempts and resulted in interspecific hybrids with white,

pink, lavender, salmon, and burgundy ray florets (Boyle & Stimart, 1989), thus considerably broadening the flower color range. Full exploitation of the genetic variability within Z. marylandica by sexual recombination or asexual breeding techniques will probably extend the flower color range beyond that observed to date.

Evaluation of Z. marylandica seedlings in greenhouse and outdoor field trials has demonstrated that plants are highly ornamental and prolific in flowering. In addition, the seedlings exhibit high levels of resistance to Alternaria zinniae and Erysiphe cichoracearum and moderate to high levels of resistance to Xanthomonas campestris pv. zinniae (Terry-Lewandowski & Stimart, 1983). Unique combinations of flower color and plant habit have been obtained through interspecific hybridization, and Z. marylandica germplasm provides an expanded gene pool for development of ornamental characteristics not previously found in either parental species.

#### Acknowledgments

We thank Kandis Elliot for the artwork.
